## VIEWS

### In The Spotlight

**Understanding FLT3 Inhibitor Resistance to Rationalize Combinatorial AML Therapies** ............. 113

A. Shastri, J. Gonzalez-Lugo, and A. Verma

*See article, p. 125*

**MYC and TFEB Control DNA Methylation and Differentiation in AML** ........... 116

X. Wu and R.N. Eisenman

*See article, p. 162*

### Science in Society

**Recommendations on Eliminating Racial Disparities in Multiple Myeloma Therapies: A Step toward Achieving Equity in Healthcare** ............. 119

**Patterns of Resistance Differ in Patients with Acute Myeloid Leukemia Treated with Type I versus Type II FLT3 Inhibitors** ........... 125

*See commentary, p. 113*

## RESEARCH ARTICLES

### Ectopic Humanized Mesenchymal Niche in Mice Enables Robust Engraftment of Myelodysplastic Stem Cells

*Précis:* Human bone marrow stromal niche engineering in mice supports long-term engraftment of primary patient MDS cells with preserved disease characteristics.

### A Therapeutic Strategy for Preferential Targeting of TET2-Mutant and TET Dioxygenase-Deficient Cells in Myeloid Neoplasms

*Précis:* 2HG accumulation from IDH1/2 mutation induces synthetic lethality in TET2-mutant cells by reducing TET activity below essentially required. A new TET inhibitor mimics 2HG and selectively restricts clonal evolution of TET2-mutant cells in vitro and in vivo.

### TFEB Links MYC Signaling to Epigenetic Control of Myeloid Differentiation and Acute Myeloid Leukemia

*Précis:* MYC directly inhibits expression of TFEB, which serves as a tumor suppressor in AML via promoting myeloid differentiation and cell death. TFEB induces IDH1/2 expression to establish myeloid epigenetic programs, and it is a druggable target in AML.

*See commentary, p. 116*
TET dioxygenases initiate DNA demethylation and are commonly inactivated in myeloid neoplasms by somatic mutations or metabolically by 2-hydroxyglutarate (2HG) product of mutant IDH1/2 enzymes. In this issue, the team of Jha, Maciejewski, and colleagues shows that minimal TET activity is essential for neoplastic cell survival and underlies synthetic lethality of TET and IDH mutations. To prove the concept and harness it for therapy, the authors develop TETi76 as a mimic of 2HG. TETi76 inhibits TET activity and mimics synthetic lethality of IDH mutation in TET-deficient cells while sparing normal hematopoiesis. TETi76 selectively restricts clonal expansion of TET2-mutant cancer cells in mouse xenografts. For details, please see the article on page 146.
